

FRACTURED SCIENCE

It's a runaway process
soft radiation cooling
a hot flow on the inside
Boundary layers
of hot accretion flows
Such a hot flow can
discriminate between lines
Testing the property
of radiation on a
sub-Keplerian rotation rate

Study but a single drop
at the entrance of
hot pyroclastic flows
into water where
ash fountains do feed
pyroclastic surges
here the littoral micro explosions
facilitate mass water transport
over entire surface areas

Procedurally ---cool calculation
ignores simply reasoning.

Leaving reality
searching again
for safe harbor
